# A Survey of Current End-user Data Analytics Tool Support

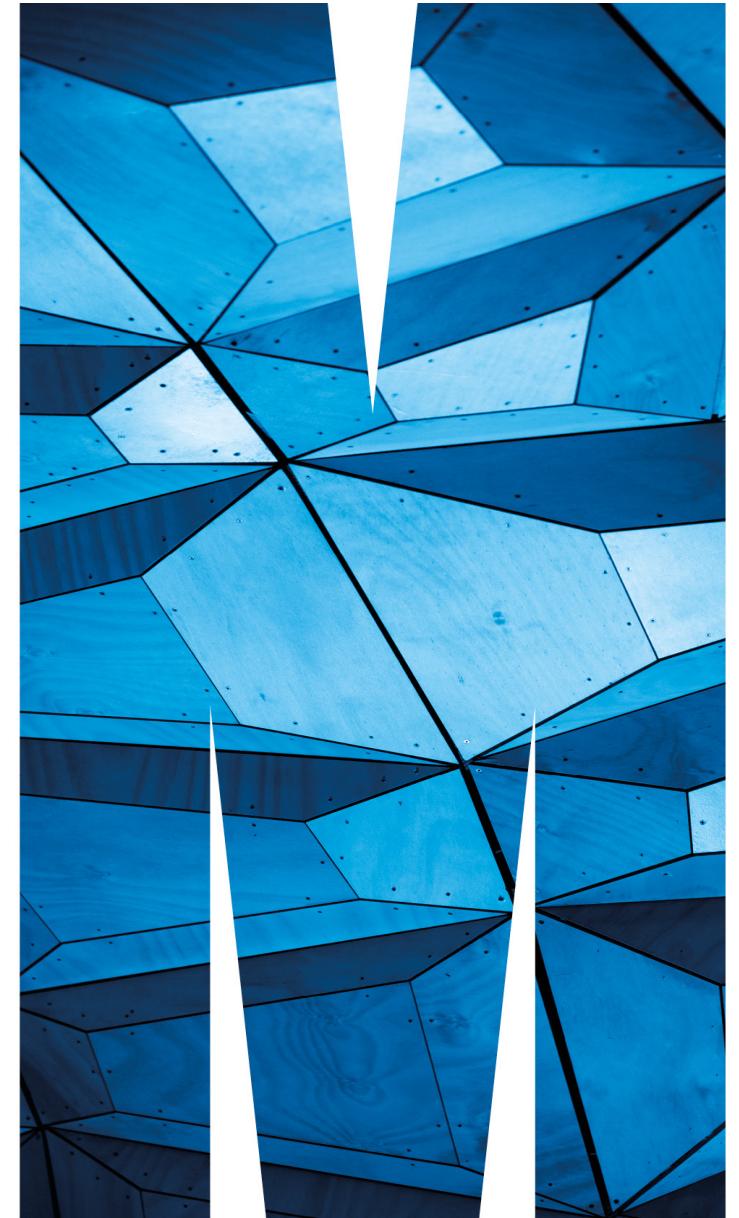

Hourieh Khalajzadeh, Deakin

Mohamed abdelrazek, Deakin

**John Grundy, Monash**

John Hosking, Auckland

Qiang He, Swinburne

## Outline

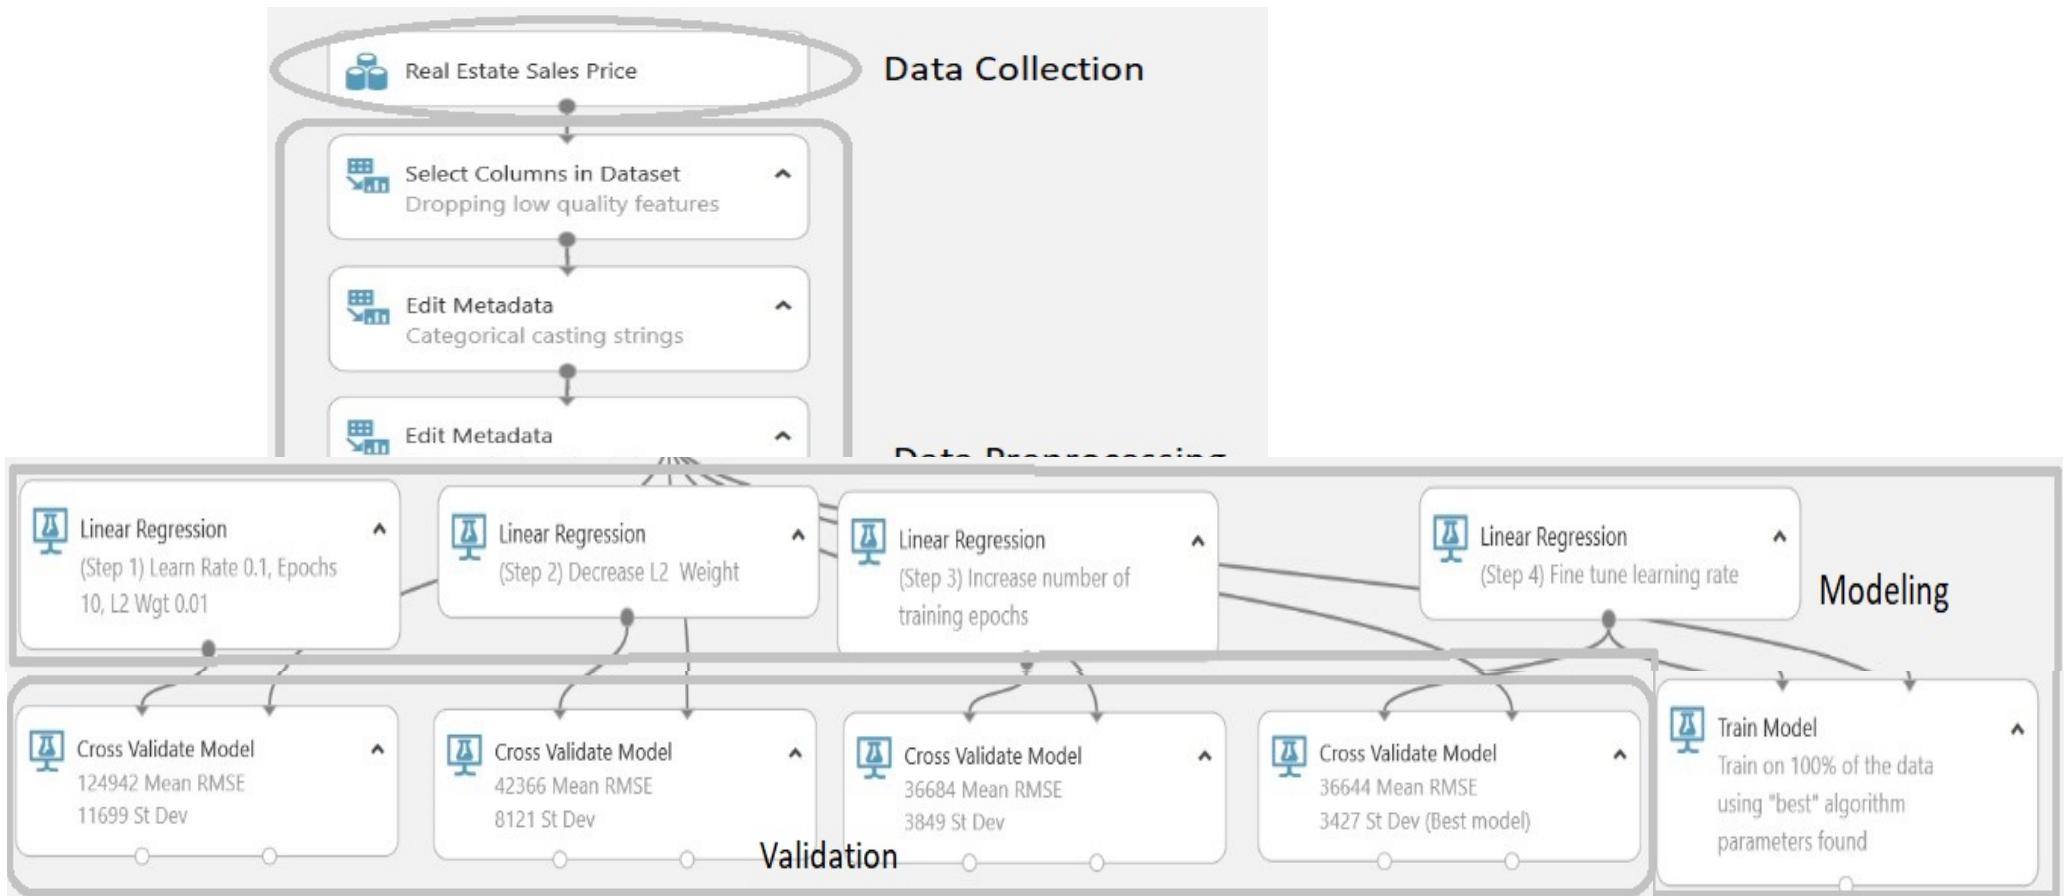

- Data analytics stages
- Key requirements for end user data analytics tools
- Existing end user data analytics tools
- Issues, strengths and weaknesses
- Research directions
- Conclusions

## Data Analytics Stages

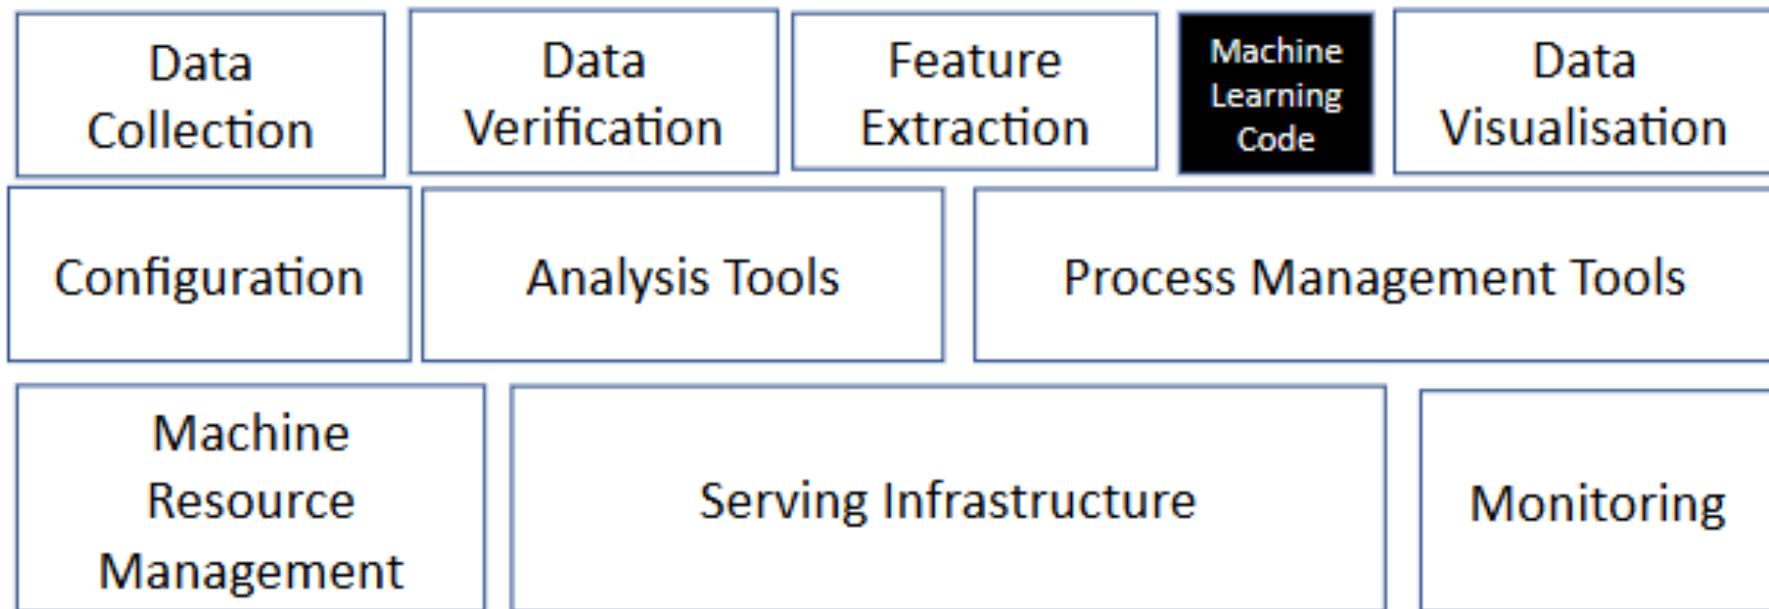

- Classifying the problem
- Acquiring data
- Processing data
- Modeling the problem
- Validation and execution
- Deploying

C. E. Sapp, “Preparing and Architecting for Machine Learning”, Gartner Technical Professional Advice, 2017.

## Example: Real Estate Sales Price Prediction Project in Azure ML Studio

## Artificial Intelligence Systems Development Building Blocks

Only a small component of real-world ML systems is the ML model.  
The required surrounding infrastructure is vast and complex.

## Traditional Software Development Lifecycle (SDLC)

- Elicitation & Analysis of the requirements
- Design
- Implementation
- Testing
- Maintenance

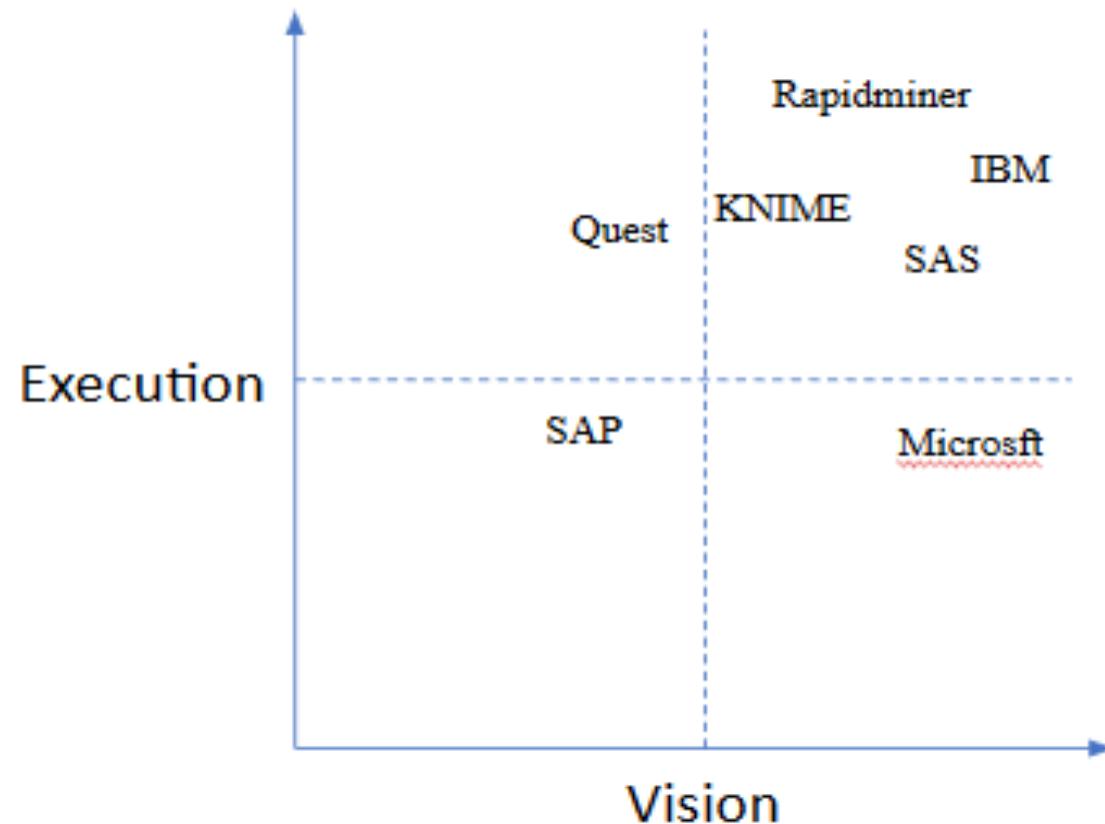

## What should Big Data Analytics Software support?

- Diverse data ingestion
- Wrangling and cleansing
- Data integration and querying for very large data volumes
- Feature extraction and selection
- Tailoring and combination of diverse data analytics techniques
- Integration of diverse software and services
- Communication of findings and integration with existing IT solutions
- Quality of service attributes including: scalability, privacy, security, reliability and adaptability to changes in the target environment

## Key Requirements for End User Data Analytics Tools

- Support all data preprocessing operations e.g. cleaning, wrangling, anomaly detection
- Want it to be understandable and useable for domain experts, data scientists, and even users with very limited data science and programming knowledge
- Cover a variety of the algorithms for each stage of data processing, modeling and evaluation processes.
- Offer flexible options for experienced users such as data scientists
- Cover all AI-SDLC stages including problem description, requirements, design, implementation, testing and deployment
- Be industry ready for large scale industry-based projects
- Be cost effective, be deployable on the cloud, on premises or both

## Gartner 2017 Magic Quadrant for Data Science Platforms

## Existing Data Analytics Tools & AI Systems Building Blocks

- Variety of tools developed to automate the ML code as well as the data verification and feature extraction phases
- We group these components (building blocks of an AI-powered systems) into three groups:
  - **DataOps** - includes data collection/ingestion, data validation cleansing, wrangling, filtering, union, merge, etc.
  - **AIOps** - covers feature engineering and model selection, model training and tuning, use of variety of ML, AI techniques
  - **DevOps** - covers model integration and deployment, monitoring and serving infrastructure

## From the Viewpoint of AIOps

- tools such as Tableau, Plotly, and Trifacta
- focus on data operations such as visualization, data cleaning, data wrangling, and so on.
- Interactive visualisation

# Example of Tableau in use for real estate data analysis

Tableau - Superstore [Read-Only]      Tableau - Superstore [Read-Only]

## From the Viewpoint of AIOps

- large number of tools focusing on the artificial intelligence and machine learning operations
- Some examples are Azure ML Studio, Amazon AWS ML, Google Cloud ML, BigML, Weka, Rapidminer, IBM Watson ML, SAS, KNIME, and Tensorport
- tools in this group also often cover DataOps to some extent

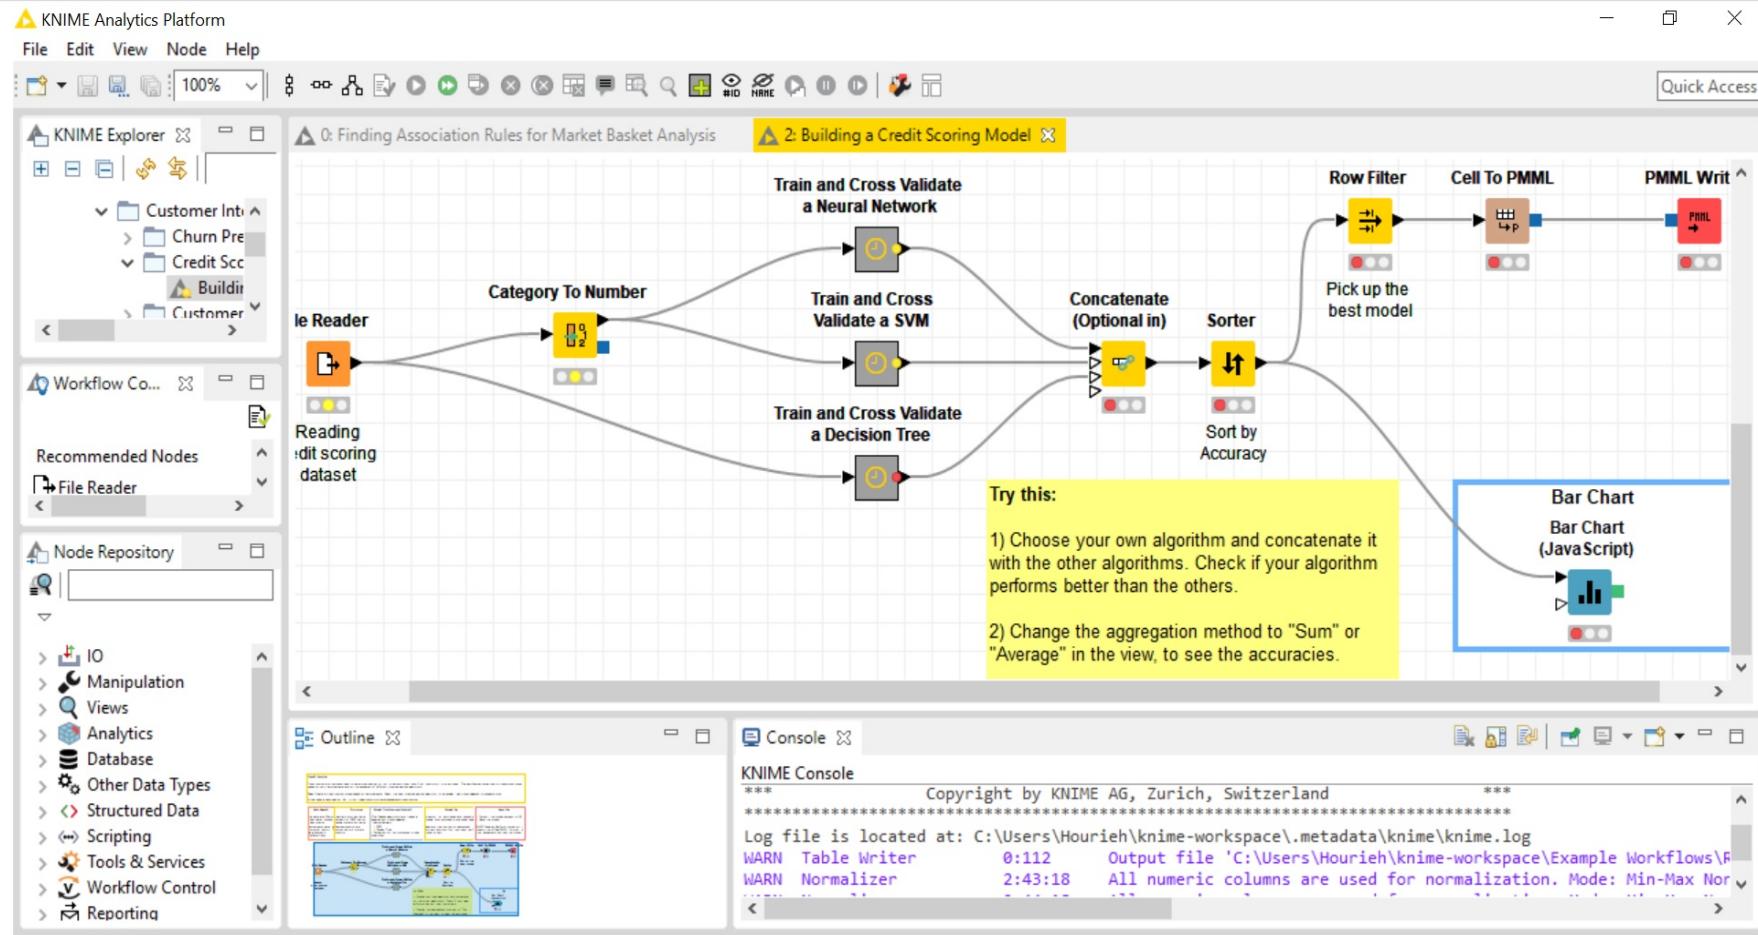

# An example of Azure ML Studio in use

## From the DevOps Point of View

- Some tools focus on the deployment of the solutions on the cloud or on premises as well as building industry ready solutions
- Some examples are Rapidminer, IBM Watson ML, SAS, and KNIME
- These tools assist to prepare industry ready solutions deployable on both cloud and on premises

# An example of KNIME in use

## Strengths and Weaknesses (see paper for details...)

End Users Tools	SDLC phases										Tool usability					
	Business problem description		Requirements		Design		Implementation		Testing		Deployment		DevOps		Industry ready	
	DataOps	AIOps														
Tableau	✓						✓		✓		✓		✓		✓	✓
Plotly	✓						✓		✓		✓		✓		✓	✓
Trifacta	✓						✓				✓				✓	✓
Azure ML Studio	✓	✓					✓				✓		✓			✓
Amazon AWS ML	✓	✓					✓				✓		✓			
Google Cloud ML	✓	✓					✓				✓		✓		✓	
BigML	✓	✓					✓		✓		✓		✓			✓
Weka	✓	✓					✓		✓		✓		✓			
Rapidminer	✓	✓					✓		✓		✓		✓			
IBM Watson ML	✓	✓					✓		✓		✓		✓		✓	✓
SAS	✓	✓					✓		✓		✓		✓		✓	✓
KNIME	✓	✓					✓		✓		✓		✓		✓	✓
TensorPort	✓						✓		✓		✓		✓		✓	✓

## Gaps in existing tools. (see paper for details)

- Current practices and tools do not cover most activities of analysis and design, esp business requirements
- Most focus on low-level data analytics process design, coding and visualization of results
- Most assume data is in a form amendable to processing – but most datasets are not “clean” nor “integrated”, and great effort is needed to source the data, integrate, cleanse, harmonize, pre-process it
- Only a few offer the ability for data science experts to embed new code and expand the algorithms based on their needs
- Most only cover parts of the DataOps, AIOps, and DevOps of the data analytics life cycle
- Many real-world problems require large datasets to be processed and thus require deployment of solutions on complex, powerful computing infrastructure
- Many tools provide a variety of visualization support to show results to end users to support business decision making but are limited to built-in visualization options

## Research Directions

- Support domain expert end users to better capture their requirements about target domain problems
- Better support for complex and large datasets, including handling partial and incomplete datasets
- Need both simplicity for non-experts with no data science and programming knowledge, and support for expansion and tailoring for data science experts need to be provided
- Want tool features to capture requirements and changes in requirements as well as adapting the solution based on these changes
- Need scaling and distribution for many real-world applications while balancing this against limited end user knowledge of computing platforms
- Further enhance information visualization capabilities including interactive exploration and end user specification of complex visualizations for the target domain.

## Conclusions

- Data analytics phases can be divided to DataOps, AIOps, and DevOps
- Leading data analytics tools address some of these tasks
- Most current tools currently focus on
  - data analytics and machine learning
  - modeling and implementation
  - visualisation
- Many existing tools are complicated for a domain expert with no data science and programming background
- Many are not designed to allow for collaboration between the key stakeholders (team members)
